

bluesign® system black limits (BSBL)

Threshold limit values for chemical substances in chemical products

Version 5.0 | 01 July 2023

1. Introduction

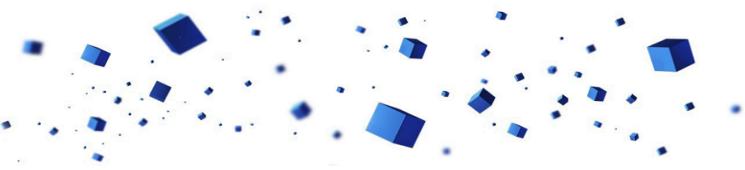

The bluesign® system black limits (BSBL) specifies threshold limits for chemical substances in finished chemical products such as auxiliaries or dyes. It includes mainly all substances from the publicly available bluesign® system substances list (BSSL) Consumer safety limits for which a usage ban is defined. These could, for instance, be substances with carcinogenic, mutagenic or reprotoxic properties, or those falling under the POPs Regulation (The European Commission Regulation on persistent organic pollutants). One substantial example of these substances are monomers such as acrylamide or acrylonitrile. All of them might be present in polymers and must be controlled by bluesign® SYSTEM PARTNERS from the chemical industry.

Whereas the bluesign® TOOL includes, apart from the BSBL substances, also many other substances with limits in mixtures (e.g. dyes or auxiliaries) that depend on the relevant application situation and exposure scenario, the BSBL limits illustrate the minimum threshold limits independent from any type of application and strictly follow the precautionary hazard-based approach.

The BSBL threshold limits are to be seen as a minimum requirement, as a gate keeper for undesirable substances following a hazard-based approach. Independent from this, the bluesign® TOOL calculates individual limits considering process and application conditions which can lead to even more stringent limits.

All chemicals registered in the bluesign® FINDER, a positive list of commercially available chemical products that passed the bluesign® CHEMICAL ASSESSMENT, comply with the BSBL limits. Data on all bluesign® FINDER registered chemicals are delivered by bluesign® SYSTEM PARTNERS from the chemical industry which all follow a Responsible Care approach with excellent knowledge on product stewardship and have outstanding environmental and occupational health and safety performance. Only by these means can a well-founded assessment of the respective chemical products be performed. Further, limits for substances in chemical products (included in the BSBL) as well as in articles (included in the BSSL) can be derived.

Through bluesign® CHEMICAL ASSESSMENT and CHEMICALS MANAGEMENT, of which the BSBL is just one building block, bluesign drives a powerful, conscientious and sustainable change towards safer chemicals in textile manufacturing.

2. Definitions and Abbreviations

2.1. BSBL

bluesign® system black limits. A list that specifies threshold limits for chemical substances in finished chemical products such as auxiliaries or dyes.

2.2. BSSL

bluesign® system substances list consumer safety limits. A list that specifies consumer safety limits for chemical substances in articles. It also defines usage bans for chemical substances prohibited from the manufacturing of articles.

2.3. bluesign® FINDER

Web-based online database containing positive list of preferred chemicals (e.g. dyestuffs, auxiliaries). It serves as a search engine designed to help manufacturers in finding bluesign® APPROVED chemical products.

2.4. bluesign® SYSTEM

The bluesign® SYSTEM integrates the relevant players across the supply chain, sets criteria and defines actions that determine their behavior towards human and environmentally friendly production and products.

2.5. bluesign® TOOL

Web-based software application for chemical assessment and rating of chemical products.

2.6. CAS Number

CAS numbers are unique numerical identifiers for chemical elements, compounds, polymers, biological sequences, mixtures or alloys. Chemical Abstracts Service (CAS), a division of the American Chemical Society, assigns these identifiers to every chemical that has been described in the literature. The intention is to make database searches more convenient, as chemicals often have many names. Almost all molecule databases today allow searching by CAS numbers.

2.7. Chemical Product / Chemical

A commercial product which can be a chemical substance or a mixture.

2.8. Chemical Substance

A chemical element and its compounds with constant composition and properties. It is defined by the CAS number.

2.9. Member

This term describes a member of a group of restricted substances. It can be a chemical substance, or a subgroup of substances.

2.10. Mixture

A chemical product composed of two or more substances. It can be, for example, a colorant or an auxiliary.

2.11. Monitoring

For some chemical substances toxicological and / or ecological properties are not yet well defined. Therefore, the risk assessment is not complete. For some substances sufficient information on possible / typical contamination of articles and chemical products is not available now. Those substances are under observation. Exact restrictions will be defined as soon as more information exists. In cases where monitoring status is accompanied by a limit value, the limit value should be the goal.

2.12. Sector of Use

This is part of an innovative concept for the assessment of chemical products, where bluesign uses an approach, similar to the REACH system for the risk-based evaluation of chemical substances and transfers this to the evaluation of chemical products. This allows a product, process and industry specific assessment of risks to human and the environment, that can be adapted to all kind of industries. Some Sectors of Use are combined to groups. These are the applied Sectors of Use:

| Sector of Use Group | Sector of Use |
|---------------------|---|
| Textile | Fibers / yarns |
| | Textile articles including fabrics, laminates and non-woven fabrics |
| | Garments and other finished textile articles |
| Down/feather | Down and feather articles |
| Leather | Leather articles |
| Polymer parts | Plastic articles |
| | Rubber articles |
| Metal parts | Basic metals, including alloys |
| | Fabricated metal articles |

2.13. Several

When a substance group is not defined by a single CAS number, the field CAS Number contain the entry "Several". Several does not in every case mean that the whole substance group is restricted (e.g. aldehydes, amines), in case of a restriction on the whole substance group, this is reflected by an entry for the limit or a corresponding comment. For substance groups, especially for big ones, some or all members are listed in Annex I. When group members are listed in Annex I, this is indicated in the comment for the group.

2.14. Substance Groups

For better readability and to show the hierarchy of substance groups the BSSL lists:

- Main substance groups (bold, normal letter)
- Subgroups (bold, italic letter)
- Subsubgroup (italic letter)
- Single substances (normal letter)

2.15. Threshold Limit Value

The maximum amount of a chemical substance permitted in a finished chemical product, independent from process and application conditions to be registered in the bluesign® FINDER. This is only one part of the evaluation, the bluesign® TOOL calculates individual limits considering process and application conditions which can lead to even more stringent limits.

2.15.1. Detection Limit (DL)

The lowest quantity of a substance that can be distinguished from the absence of that substance with a stated confidence level.

2.15.2. Quantification Limit (QL)

The lowest analyte concentration, that can be quantitatively detected with a stated accuracy and precision.

2.16. Usage Ban

For most chemical substances or substance groups in the BSBL a usage ban is defined. For these substances or substance groups intentional use in manufacturing of articles is prohibited. This means that chemical products (e.g. colorants or textile auxiliaries) used for manufacturing of articles must not intentionally contain these substances or substance groups. The aim of a usage ban is to avoid release of harmful substances to workers, the environment and to avoid occurrence in the manufactured article by applying the precautionary principle.

2.17. Usage Restriction

For some substances or substance groups a usage restriction is defined. In these cases an intentional use is allowed, but the concentration in the chemical product is restricted (e.g. for substances with usage restrictions but no consumer safety limits or free content of blocking agent).

3. Testing Methods

Testing shall be the last resort to confirm the absence of BSBL substances in finished chemical products (mixtures). This evidence is preferably adduced by Input Stream Management. That means for example appropriate selection of raw material suppliers, defining raw materials specifications, raw material control, process- and quality management at the production site.

"Recommended analytical test methods (e.g. GC-MS or LC-MS) are given in a separate column in the tables of section 6. Wherever possible, reference to a standard method (e.g. ISO) is given.

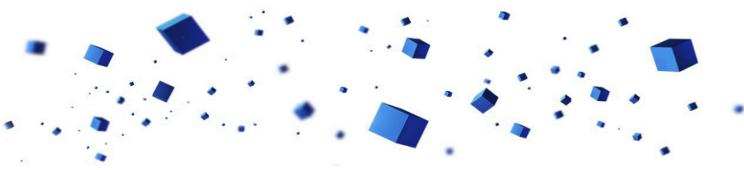

Sample preparation depends strongly on the sample matrix (powder, liquid, solvent- or water based, pH, viscosity of the mixture, other substances in the mixture, etc.). Therefore, the choice of sample preparation is tailor made for each single tested chemical product and shall always be adjusted to the sample matrix.

All testing methods shall define the total content of the substance in the mixture. High recovery rate and low uncertainty shall be obtained. Robustness of the method shall be given.

4. SVHC

Some substances of very high concern (SVHC; Candidate List in accordance with Article 59(10) of the REACH Regulation) are listed in the BSBL directly with limits which can be lower than the EU defined limit of declaration, which is 1000 mg/kg. For all SVHCs not directly listed in the BSBL, a threshold limit of 1000 mg/kg is valid and a reporting limit of 100 mg/kg is fixed.

5. Scope and Validity

5.1. Scope

This document specifies threshold limits for chemical substances in chemical products. All bluesign® APPROVED chemical products must comply with these limits.

5.2. Validity

BSBL 5.0 comes into force on 01 July 2023. It replaces the bluesign® system black limits (BSBL), version 4.0 from 01 July 2022.

This document is revised annually and in line with the latest legislation and research. It is supported by the opinions of the bluesign® SYSTEM PARTNER experts.

For all bluesign® SYSTEM PARTNERS the implementation of the revised sections, unless stated otherwise, shall take place by 01 July 2024 at the latest.

6. Threshold Limit Values

This chapter informs on threshold limits for chemical substances in chemical products.

Restrictions and Bans for PFAS based Chemicals and Articles

- Since July 2022 no new registration of PFAS based chemical products in bluesign® FINDER.
- Since July 2023 all PFAS based chemicals have been phased out from bluesign® FINDER.
- Since July 2023 no new registration of articles finished with PFAS based chemicals.
- From July 2024 all articles finished with PFAS chemistry will be phased out from the bluesign® GUIDE.
- Exceptions might be possible, for more details see "Guidance Sheet PFAS phase out."

Analytical proof that PFAS chemicals are not included:

At first screening test for total Fluorine via combustion ion chromatography (EN14582 or ASTM 07359; Quantification Limit: 50 mg/kg).

Followed by confirmatory testing on single substances in case of findings (requires information from the supply chain on possible fluorine compounds).

Regarding the definition of PFAS, we will follow the EU restriction proposal:

Any substance that contains at least one fully fluorinated methyl (CF_3-) or methylene ($-\text{CF}_2-$) carbon atom (without any H/Cl/Br/I attached to it).

A substance that only contains the following structural elements is excluded from the scope of the restriction:

$\text{CF}_3\text{-X}$ or $\text{X}\text{-CF}_2\text{-X}'$, where $\text{X} = \text{-OR}$ or $\text{-NRR}'$ and $\text{X}' = \text{methyl } (-\text{CH}_3)$, methylene $(-\text{CH}_2-)$, an aromatic group, a carbonyl group $(-\text{C(O)}-)$, -OR'' , -SR'' or -NR''R''' ; and where R/R'/R''/R''' is a hydrogen (-H), methyl (- CH_3), methylene (- CH_2-), an aromatic group or a carbonyl group $(-\text{C(O)}-)$.

This definition might affect also substances that do not fall into the typical application of water/oil/stain repellents. For the time being, as the EU general PFAS restriction is not yet in force and exceptions are not fixed, bluesign will focus in its phase out concept on PFAS substances that are used in water/oil/stain repellents. bluesign reserves the right to extend the restriction to other applications after expert judgement.

Annex I lists individual substances that belong to substance groups.

Please note that not all ETAD-listed metals (ETAD Code of Ethics Annex A, <https://etad.com/en/about-etad/code-of-ethics.html>) are explicitly mentioned here. The reason is that BSBL contains only substances of very high concern regarding people and environment and follows a precautionary hazard-based approach. ETAD restricts also metals only for other reasons, for example iron. All bluesign® SYSTEM PARTNERS are obliged to keep the ETAD limits for metals in colorants (see bluesign® CRITERIA, effective version).

Annex I Compilation of Individual Substances

The tables from Annex I list individual substances that belong to the following substance groups:

- Alkylphenolethoxylates (APEOs)
- Alkylphenols (APs)
- Arylamines
- Chlorinated Benzenes and Toluenes
- Colorants
- Dioxins and Furans
- Enzymes
- Flame Retardants
- Greenhouse Gases, fluorinated
- Halogenated Biphenyls, halogenated Terphenyls and halogenated Naphthalenes
- Metals
- Other Chemical Substances
- Ozone Depleting Substances (according to Regulation (EC) No 1005/2009)
- PFAS (Poly- and perfluoroalkyl substances)
- Tin-Organic Compounds

Threshold limit values and test methods for the substance groups are provided in section 6.
